

2019 Water Quality Report

Hart County Water and Sewer Authority ID#1470065

The Hart County Water and Sewer Authority (HCWSA) is pleased to report that your tap water met or exceeded United States Environmental Protection Agency (EPA) and Georgia Environmental Protection Division (EPD) drinking water health standards. Once again our system has not violated a maximum contaminant level or any other water quality standards.

In 2019, HCWSA purchased all of its treated water from the City of Hartwell (Water System ID #1470000), the City of Lavonia (Water System ID #1190003) and the City of Royston (Water System ID #1190004). Hartwell withdraws water from Hartwell Lake at Lightwood Log Creek. Lavonia withdraws water from both Hartwell Lake near Franklin County Boat Ramp Road and Crawford Creek Reservoir. Royston withdraws water from the North Fork of the Broad River, from a well on Brooks Street within the city limits, and from a well on Royston Highway in Hart County. Each city treats its source water to remove contaminants and bacteria. Each of the cities has had a Source Water Assessment performed; copies may be obtained by contacting HCWSA.

The sources of drinking water (both tap and bottled) include rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water include: microbial contaminants, such as viruses and bacteria that may come from sewage treatment plants, septic systems, agricultural livestock operations and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban runoff, industrial or domestic wastewater discharges, oil and gas production, mining or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems, and; radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities.

In order to ensure tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling EPA's Safe Drinking Water Hotline (800 426 4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA and the Centers for Disease Control and Prevention (CDC) guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the Safe Drinking Water Hotline (800 426 4791).

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. HCWSA is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

HCWSA is a vital part of our community and drinking water is our most precious commodity. Therefore, it is necessary for all of us to work together to conserve and protect our source water as well as our drinking water. If you notice any

suspicious activity or vandalism around facilities such as elevated water tanks or fire hydrants, please contact our office immediately at 706 377 4387.

HCWSA's Board of Directors normally meets on the third Monday of each month at 6:00pm in our office at 200 Arthur Street, Hartwell. Your participation or comments are welcome at these meetings or at any other time. Copies of this report may be obtained at our office 8:30am - 5:00pm Monday through Friday.

Water Quality Data

The table below lists all of the drinking water contaminants that were detected during the 2019 calendar year. The presence of contaminants in the water does not necessarily indicate that the water poses a health risk. Unless otherwise noted, the data presented in this table is from testing done January 1 – December 31, 2019. EPD requires us to monitor for certain

Term

contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year. Some of the data, though representative, is more than one year old.

Water Quality Data Table							
Inorganic Contaminants							
Parameter	MCL	MCLG	Your Water	Range of Detection	Sample Date	Violation ?	Typical Source of Contaminant
*Fluoride (ppm)	4	4	0.67	0.12 – 1.22	2019	No	Water added that promotes strong teeth
Parameter	AL	MCLG		# of sites found above AL			
Lead (ppb)	15	0	0	0	2017	No	Corrosion of household plumbing system
Copper (ppb)	1300	0	8.1	0	2017	No	Corrosion of household plumbing system
Disinfectants and Disinfectant Byproducts							
Parameter	MRDL	MRDLG		Range of Detection			
Chlorine (ppm)	4	4	1.18	0.33 – 1.93	2019	No	Water added used to control microorganisms
Parameter	MCL	MCLG					
Total Trihalomethanes (ppb)	80	N/A	**55.9	14.6 – 67.3	2018 2019	No	By-product of drinking water chlorination
Haloacetic acids (ppb)	60	N/A	**37.1	14.2 – 60.0	2018 2019	No	By-product of drinking water chlorination
Microbiological Contaminants							
Parameter	MCL	MCLG		Range of Detection			
Total Coliform Bacteria	0	0	0	0	2019	No	Naturally present in environment
*Total Organic Carbon (ppm)	TT	N/A	0.90	0.59 – 1.55	2019	No	Naturally present in environment
*Turbidity (NTU)	TT=1	N/A	0.05	0.02 – 0.29	2019	No	Soil runoff erosion
	TT=% of samples ≤0.3	N/A	100%	N/A	2019	No	Soil runoff erosion

* Sampling performed and data provided by the City of Hartwell, the City of Lavonia, and the City of Royston.

** This represents the highest quarterly locational running annual average during 2019.

AL	Action Level: The concentration of a contaminant which, when exceeded, triggers treatment or other requirements which a water system must follow.
MCL	Maximum Contaminant Level: The highest level of a contaminant that is allowed in drinking water.
MCLs are set as close	to the MCLGs as feasible using the best available treatment technology.
MCLG	Maximum Contaminant Level Goal: The level of a contaminant in drinking water below which there is no
known or	expected risk to health. MCLGs allow for a margin of safety.
MRDL	Maximum Residual Disinfectant Level. The highest level of a disinfectant allowed in drinking water.
There is convincing	evidence that addition of a disinfectant is necessary for control of microbial contaminants.
MRDLG	Maximum Residual Disinfectant Level Goal. The level of a drinking water disinfectant below which
there is no known or	expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control
microbial	contaminants.
N/A	Not Applicable
NTU	Nephelometric Turbidity Units. Turbidity is a measure of the cloudiness of the water and is a good
indicator of the	effectiveness of Hartwell's, Lavonia's, and Royston's filtration systems.
ppb	parts per billion, or micrograms per liter
ppm	parts per million, or milligrams per liter
TT	Treatment Technique: A required process intended to reduce the level of a contaminant in drinking water.
